

What is Intain Markets

Learn about the Intain Markets platform and its capabilities for structured finance transactions

Overview

Intain Markets is a comprehensive digital infrastructure platform designed to bring transparency, efficiency, and security to structured finance transactions. It serves as a unified ecosystem where all parties involved in financial deals—from issuers and borrowers to investors and lenders, market makers and facility agents to servicers and rating agencies—can collaborate seamlessly through secure, workflow-driven processes. The platform handles the complexity of coordinating multiple parties, managing status transitions, tracking approvals, and maintaining relationships, allowing you to focus on your business decisions rather than the mechanics of transaction management.

How the Platform Is Designed

Intain Markets is built on the fundamental principle that structured finance transactions require careful coordination between multiple parties, each with distinct roles and responsibilities. The platform recognizes that these transactions are not simple one-time exchanges, but complex workflows that progress through defined stages, require approvals at critical points, and must maintain complete transparency throughout their lifecycle.

The platform is architected as a collaborative environment where:

Workflows Guide Progression - Every transaction type follows a structured path from creation to completion, with clear stages and decision points. Whether you're creating pools for securitization, submitting term sheets for credit facilities, or managing loan portfolios, the platform guides you through the appropriate sequence of steps, ensuring that important stages aren't skipped and prerequisites are met before proceeding.

Statuses Reflect Position - Each item in the platform has a status that indicates where it is in its journey and what can happen next. Statuses are not just labels—they actively control what actions are available, ensure proper progression, and prevent skipping important steps. Understanding statuses helps you know what to expect and what you can do at each stage.

Approvals Ensure Quality - Critical stages require review and approval from authorized parties before proceeding. Approvals are not obstacles but quality checkpoints that ensure items meet standards, comply with requirements, and have proper authorization before commitment. This protects all parties involved and maintains quality throughout the process.

Roles Define Capabilities - Each user's role determines what they can see, what actions they can take, and what responsibilities they have. The platform automatically filters information and actions based on your role, showing you only what's relevant and appropriate for your responsibilities. This role-based approach ensures proper separation of duties and maintains workflow integrity.

Sharing Enables Collaboration - Items can be shared with multiple parties simultaneously, allowing parallel review and input. Issuers can share pools with market makers and investors, borrowers can submit term sheets to facility agents, and multiple parties can collaborate on transactions without conflicts. This sharing capability enables efficient multi-party collaboration.

Traceability Provides Accountability - Every action, status change, and decision is recorded with who did what and when. This complete traceability ensures accountability, supports compliance, and provides transparency for all parties. You can see the complete history of any item, understand how it progressed, and identify who was responsible for specific actions or decisions.

The platform handles the complexity of coordinating these elements automatically, ensuring that workflows progress correctly, approvals happen in the right order, and all parties stay informed of relevant changes. This automation reduces errors, ensures consistency, and allows you to focus on your business decisions rather than managing process mechanics.

What This Enables for Users

For Issuers and Borrowers, the platform enables you to organize your loan portfolios into pools, present investment opportunities to potential investors, submit credit facility requests, and manage transactions from initial creation through final completion—all while maintaining control over your data and visibility into the process. You can track where your submissions are in the workflow, respond to feedback, make changes when requested, and see when approvals occur. The platform ensures your submissions are reviewed by qualified parties and protects you by requiring approvals before commitment.

For Market Makers and Facility Agents, the platform provides tools to review opportunities, accept mandates to structure deals, provide feedback and request changes, review and approve submissions, and facilitate transactions—helping you add value through structuring and coordination. You can see pools and term sheets submitted for your review, make informed decisions about mandates and approvals, request improvements when needed, and track transactions through to completion. The platform gives you clear decision points and ensures you review items at the appropriate stage.

For Investors and Lenders, the platform offers visibility into investment opportunities, the ability to review pool characteristics and loan details, tools to approve or reject funding requests, and tracking of your investments—enabling informed decision-making and efficient capital deployment. You can evaluate opportunities thoroughly, make independent decisions about participation, track your investments, and see complete information about opportunities you're considering. The platform ensures you have the information you need to make informed decisions.

For Servicers and Paying Agents, the platform supports ongoing administration by providing access to assigned pools and facilities, tools to manage loan servicing and payment distributions, and tracking of ongoing activities—ensuring smooth post-deal operations. You can manage loan portfolios, track payments, update loan statuses, handle payment distributions, and ensure proper ongoing administration. The platform provides the tools you need for effective post-deal management.

For Rating Agencies, the platform provides read-only access to pool information for analysis and rating purposes, enabling thorough evaluation while maintaining appropriate access controls. You can access pool data, analyze characteristics, review loan details, and perform rating analysis while maintaining appropriate security and access controls.

Across All Roles, the platform enables collaboration without confusion, maintains security through role-based access, ensures compliance through structured workflows, and provides complete transparency through comprehensive audit trails. Everyone benefits from the structured approach, quality assurance, compliance support, and transparency that the platform provides.

Key Principles to Understand

Workflow-Driven Design - The platform is built around workflows, not just features. Every action fits into a larger process, and the system guides you through the appropriate sequence of steps. Understanding workflows helps you know what needs to happen next and how your actions fit into the overall transaction process.

Status-Based Control - Statuses are not just labels—they control what actions are available, ensure proper progression, and prevent skipping important steps. Understanding statuses helps you know what to expect and what you can do at each stage. When actions are disabled, it's usually because the status doesn't allow them yet, or prerequisites haven't been met.

Approval Gates - Approvals are not obstacles but quality checkpoints. They ensure that items meet standards, comply with requirements, and have proper authorization before proceeding—protecting all parties involved. Understanding approvals helps you appreciate their value in ensuring quality and maintaining compliance.

Role-Based Access - Your role determines your view and capabilities. The platform automatically filters information and actions based on your role, showing you only what's relevant and appropriate for your responsibilities. Understanding your role helps you know what you can see and do, and what others can see and do.

Collaborative by Design - The platform is built for multi-party collaboration. Sharing, feedback, and parallel review are core capabilities, not add-ons. Multiple parties can work together efficiently without conflicts. Understanding collaboration helps you work effectively with other parties.

Complete Traceability - Every action is tracked, every status change is recorded, and every decision is documented. This traceability ensures accountability, supports compliance, and provides transparency for all parties. Understanding traceability helps you appreciate how the platform maintains accountability and supports compliance.

Automatic Coordination - The platform handles the complexity of coordinating multiple parties, managing status transitions, tracking approvals, and maintaining relationships—you focus on your business decisions, not the mechanics. Understanding this automation helps you appreciate how the platform simplifies complex processes.

Security and Compliance - Security is built into every aspect, from authentication and role-based permissions to digital signatures and audit trails. The platform ensures that transactions are protected and compliant. Understanding security and compliance helps you trust that your data and transactions are secure.

Understanding these principles helps you appreciate how Intain Markets brings structure, security, and efficiency to complex multi-party transactions while maintaining the flexibility and transparency needed for successful structured finance deals. These principles work together to create a platform that supports effective collaboration, ensures quality and compliance, and provides the transparency and accountability needed for structured finance transactions.
